

When the world thinks BESS, it will think Hynn.

Not because of the price. Because of what the name means — the science behind it, the people who service it, the universities that validate it, the institutions that trust it. This is how Apple became Apple. This is the partnership that makes Hynn that company in Europe.

Confidential · Strategic Partnership Proposal

Lighthief × Hynn Technology

Tuesday 25 April 2026 · Online Working Session

Following our meeting on 24 April, I want to put on paper what I believe could be a genuinely transformative partnership for both of our companies. Not a supply agreement. Not a distribution arrangement. Something that neither of us can build alone — and that none of our competitors are building at all.

A shared ambition to lead — not just to compete.

Lighthief was built on a deliberate philosophy: expertise and professionalism first, price second. In every market we entered — Poland, Italy, Germany, Spain, Cyprus, the Netherlands, Greece — we built our position through technical competence, certified teams and the long-term trust of developers and grid operators. We invested in people, in service infrastructure and in reputation long before we competed on cost. That approach has produced ~160 certified field technicians across 11 countries and signed BESS contracts that most companies would not even consider pursuing. We believe Hynn shares this philosophy. The companies that endure are not the cheapest — they are the most trusted. That is the foundation on which we want to build this joint platform together.

The window is open. It will not stay open forever.

The European BESS market is at an inflection point that comes once in a generation. The EU installed a record 27.1 GWh of new battery storage in 2025 alone. The total market value is projected at \$24.2 billion in 2026, rising to \$52.7 billion by 2031 — a 17% compound annual growth rate (Mordor Intelligence, January 2026). The five markets we are targeting together represent the majority of that value:

Germany	30% of EU market · 18 GW utility-scale demand over 10-year outlook · €105-160k revenue/MW/yr
Italy	No. 1 utility-scale market in 2025 · MACSE capacity auction ongoing · Highest revenue stack in Southern Europe

Spain	GWh-scale for the first time in 2025 · Regulatory reform accelerating · Solar co-location premium
Netherlands	Strong merchant revenue · Offshore wind integration driver · €105k+ revenue/MW/yr
Poland	Fastest growing C&I; segment · EU grant round completed · First large capacity market tenders imminent

SolarPower Europe projects annual EU BESS installations reaching 120 GWh by 2029. The market leaders of 2030 are being established right now — through reference projects, certified teams, regulatory relationships and the scientific credibility that turns a product into a trusted brand. The companies that move in 2026 with the right infrastructure and the right partner will define the market. The companies that wait will spend a decade trying to catch up.

A technology partner. A joint platform. A shared brand.

What we are proposing is not a distribution agreement. It is a co-built European market leadership position — one that Lighthief cannot reach without Hynn technology, and that Hynn cannot reach without Lighthief infrastructure, people and markets. The mutual benefit is not theoretical. It is structural. In ten years, when a developer in Berlin or Milan closes their eyes and thinks "battery storage", the name that comes to mind should be ours — jointly. Not because we were cheapest. Because we were everywhere, we were expert, we were trusted — and we built that position together, before anyone else understood what was being built. We propose to structure this in phases — starting with reference projects and training infrastructure — so that each step builds confidence and momentum for the next.

1. Joint EMS company — Hynn EMS

I propose a new Cyprus-registered entity to develop and commercialise a European EMS platform built on Hynn's BMS, EMS and PCS software stack. Lighthief brings European regulatory architecture, platform design and five active market relationships. This is the software layer that sits above every installation we build together.

QUESTIONS TO RESOLVE

- Are you contributing a technology licence or transferring IP ownership to the joint entity — and what happens to that IP if the partnership is dissolved?
- Is the EMS currently compliant with EU frameworks: NIS2, EU Cyber Resilience Act, and national grid codes in Germany, Italy and Poland?
- Can the platform manage hardware from other manufacturers via IEC 61850, Modbus and MQTT — or is it designed exclusively for Hynn systems?

2. Joint EU sales company — performance-based exclusivity

A new Cyprus entity for the joint sale and EPC delivery of Hynn BESS systems across the EU. Lighthief brings 11 active countries, ~160 certified field technicians, multi-market EPC licences and direct relationships with developers, grid operators and institutional investors. We are ready to commit the Lighthief group fully to this joint platform — and we propose a performance-based exclusivity model that protects both sides: Lighthief delivers the volumes, Hynn maintains the exclusive channel. Shared success creates shared loyalty.

QUESTIONS TO RESOLVE

- Performance-based exclusivity: we propose joint volume targets — 2026: 500 MWh · 2027: 1 GWh · 2028: 2 GWh. Exclusivity is maintained when targets are met. If either party fails its obligations, both sides retain the right to open alternative channels. Mutual accountability.
- We propose alignment on channel exclusivity: Hynn BESS in the EU to flow exclusively through our joint company — including through your subsidiaries in Heidelberg, Budapest and Lille. We see this as the natural structure for a genuine partnership.
- We suggest clarifying the certification timeline per country together — delays are a shared risk and we want a framework that protects both parties if circumstances change.
- Lighthief will continue to service existing O&M; contracts on third-party BESS already signed. We see this as protecting the reputation and client trust that serves our joint platform.
- We propose developing a joint roadmap towards BloombergNEF Tier 1 — a milestone that benefits both of us equally in terms of lender confidence and tender eligibility.

➤ *Our five reference installations — each 20 MWh — directly contribute 5 of the 6 qualified projects required for BNEF Tier 1 eligibility. We are co-building the pathway to bankability.*

The competitive gap — what no one else is doing

CLOU · Linyang · Hithium · Sungrow — the four largest Chinese BESS players active in Europe. Between them they have not published a single peer-reviewed study in a European journal, signed a single partnership with a European university, or produced one white paper validated by an independent research institution. They compete on price lists and specification sheets. That is all they have. We propose to make that irrelevant.

3. Academic partnerships and expert market positioning

This is the element that changes everything — and the one that will define our joint market position most durably. Together we will be the first BESS partnership in Europe with a validated, multi-market scientific presence. A shared expert platform that, by the time competitors understand the strategy, will already be unreachable.

PROPOSED UNIVERSITY PARTNERSHIPS PER MARKET

- Poland: AGH Krakow + Politechnika Warszawska — LFP cell degradation modelling under continental climate operating conditions.
- Germany: Fraunhofer ISE + TU Berlin — BESS prequalification for FCR and aFRR frequency regulation markets, the most demanding technical benchmark in Europe.
- Italy: Politecnico di Milano + RSE (Ricerca Sistema Energetico, under the Italian Ministry of Energy) — BESS economics and system design within the MACSE capacity market.
- Netherlands: TU Delft + TNO — BESS integration with offshore wind variability and transmission constraint management.
- Spain: UPM Madrid + CENER — performance modelling under high-irradiance conditions and Iberian grid frequency characteristics.
- 15-20 peer-reviewed publications per year. Quarterly white papers in local languages. Live real-time performance dashboards on every reference installation — publicly accessible.
- Joint presence at Intersolar Europe, EES Berlin, WindEurope and national energy conferences in each market, under co-branded Lighthief x Hynn positioning.
- Technology festival and science hub sponsorship: Hynn brand placed independently at EIT InnoEnergy (hubs in Krakow, Madrid, Munich, Paris — the EU's largest clean-tech innovation network), Campus Party Europe, VivaTech Paris and Wolves Summit Warsaw. These are not energy industry audiences — they are media, investors and policymakers who will one day decide which BESS names they trust. Sponsorship at this level costs €5–25k per event. The visibility sits alongside Siemens, Schneider Electric and Shell. That is a positioning no price sheet can buy.
- Hynn logo placed independently — not only as Lighthief x Hynn — at selected science and innovation hubs across the EU. When a researcher at TU Delft or a startup at EIT InnoEnergy sees the Hynn name on a wall, they are not seeing an advertisement. They are seeing a peer. That distinction is everything.

➤ *Expert positioning is a long-term moat, not a marketing campaign. A developer who has read three Fraunhofer co-authored reports citing Hynn performance data does not look at a price list the same way.*

4. Three certified training centres

Lighthief already operates service infrastructure in Czestochowa, Trieste and Limassol. I propose converting these into co-branded Lighthief x Hynn technical academies — the only certified BESS training network of its kind in Europe. No competitor has this. Every technician we train is a walking reference for Hynn technology.

STRUCTURE AND WHAT WE ASK FROM HYNN

- Czestochowa (Poland): primary centre for Central and Northern Europe. 3,500m² operational warehouse with adjacent 23-hectare R&D; site.
- Trieste (Italy): southern centre for Italy, Greece and the Balkans. Essential for MACSE tender compliance — Italian tenders require certified service teams as a condition of contract award.
- Limassol (Cyprus): Mediterranean and Middle East centre, serving existing contracted clients and supporting regional expansion.
- Hynn to supply: one live BESS rack + BMS + PCS section per centre as in-kind contribution (~€150-200k per centre).
- Hynn to delegate 2-3 engineers to Czestochowa for 6 months for a train-the-trainer programme — after which Lighthief runs all training independently.
- Joint certification programme under the Lighthief x Hynn brand, recognised across all EU markets and accepted in public tender prequalification.

5. Five reference installations — bridge finance via SPV

Five co-located solar and BESS projects across Poland, Germany, Italy, the Netherlands and Spain. Each 5 MWp solar with 20 MWh BESS. Each delivered through a dedicated SPV. These are not showpieces — they are operational assets generating real revenue from capacity markets and ancillary services from day one. Total capex approximately €26.4M. They also provide the documented project portfolio that puts Hynn on the path to BNEF Tier 1.

PROPOSED SPV STRUCTURE PER SITE

- Hynn contributes BESS hardware (~€2M per site) as a non-cash asset contribution to the SPV — recognised at cost, not market price.
- Hynn provides a shareholder loan (~€3.3M per site) at 4-6% p.a. in EUR, disbursed from your European holding companies (Heidelberg / Budapest) to avoid SAFE cross-border transfer restrictions.
- Lighthief contributes EPC execution, grid connection management, permitting and long-term O&M; as its in-kind contribution.
- Each SPV is refinanced 12-18 months after commissioning through infrastructure equity or project finance. Hynn recovers its shareholder loan in full. Both parties retain proportionate equity in the operating asset — generating recurring cash yield for years.
- We propose that shareholder loans flow from Hynn European holding companies (Heidelberg / Budapest) — keeping execution fast and practical. We are happy to explore the most convenient mechanism together.

➤ *Five operating projects across five EU countries, generating real revenue, co-owned by Hynn. That is the prospectus entry. That is the BNEF application. That is the story that opens every subsequent door.*

6. Why Cyprus — the natural home for our joint companies

Both entities — the EMS company and the EU sales company — should be incorporated in Cyprus. This is where Lighthief has operated its international holding for years, and it is the jurisdiction that makes most structural sense for a Sino-European partnership.

THREE REASONS THAT MATTER

- 12.5% corporate tax — one of the lowest in the EU — combined with 0% withholding tax on dividends and interest paid to non-residents. Profits flow efficiently.
- Cyprus-China Double Taxation Treaty (in force 1991): dividends from Cyprus to China capped at 5% (Article 10) versus standard Chinese rates of up to 20%. Royalties at 10% (Article 12) — directly relevant for EMS technology licensing. Nominee shareholder structures are fully legal and widely used.
- Gateway in both directions: full EU Internal Market access and active tax treaties with Saudi Arabia, UAE, Jordan, Egypt and Israel — making Cyprus the natural bridge for expansion into MENA alongside Europe.

➤ *Simple, low-cost, proven. Lighthief chose Cyprus for exactly these reasons. We recommend the same structure for everything we build together.*

We look forward to a direct and open conversation on 25 April. Lighthief has been built over many years for exactly this kind of moment — a partnership that goes beyond transactions, beyond supply agreements, beyond the next order. We believe Hynn is the right company to build this with, and we are ready to move quickly.

“We don't need to build everything at once.”

“We just need to start building it together.”

Arkadius

Founder & CEO, Lighthief International

Limassol, Cyprus · 25 April 2026
