| <p>Three phase SPDs 40T2 containing metal oxide varistors (with pluggable protection module) having a response time of less than 25ns and therefore having a low voltage protection level. The SPDs 40T2 limiting type have successfully passed the requirements of European standard EN 61653 – 11 and international IEC 61643 – 1 for class II and are suitable for type T2 providing reliable protection to electrical and electronic systems of insulation level, category IV up to category II according to IEC 60364-4-43. The three phase 40T2 SPDs (3+1) – ELEMKO 68 44 447 &amp; 68 44 448) are suitable for installation in TN and TT systems. They provide secondary protection or primary protection in areas with low lightning density or in buildings where external Lightning Protection System (LPS) is absent. They are mainly installed at the main switch board at the entrance of the distribution network 230/400V, 50Hz and they are recommended for the protection of pump stations, country houses, industries, mobile and stationary telecom facilities, radar, TV – radio stations etc.</p> |                                                                                       |
